BACK TO THE FUTURE

By Force One Magazine

Milan-based design company hiinteriors are set to make waves over the next couple of years with the release of their technologically-advanced concept bed 'Hi-Can'. Merging the disciplines of design making with technology, the company proudly states their desire to "do to furniture what Telsa is doing for cars". Certainly, the world's first 'smart-bed', which go into full-production next year after nearly a decade of designing and tweaking, looks set to disrupt the world of traditional furniture making.

Taking inspiration from the classic canopy-bed, instead, the Hi-Can takes a modernist approach to the canopy and transforms it into a technological cocoon; go to bed a lethargic caterpillar, and wake up a butterfly.

This advanced piece of furniture not only looks like it would be at home on a spaceship, but the immersive technology can even make you feel like you're on one; featuring a responsive touchpad on the headboard, the wi-fi enabled bed allows for a completely hypnotic and mesmerizing experience with the invisible speakers and HD screens

transporting occupants to wherever they wish to go. Supportive also of games consoles and Apple TV, a 'duvet day' becomes all the more appealing.

The company are currently making use of crowdfunding to allow for additional development in order to make the technology more affordable and accessible, allowing also for further development of future features which will include temperature, humidity and CO2 sensors, sleep analysis, and voice-control. This is certainly a bed for the dreamers.
